

Dear Mr. Daftarian,

Thank you for your e-mail, enclosure and kind offer of collaboration. I looked at the executive report, it is an interesting report with some alarming losses if gas injection is not implemented in this giant field. I would assume that to reach to these numbers amongst other economical considerations, you have included the early loss of gas sale based on the net present value. I am not clear what kind of model you have used for calculating your recovery values. If a dynamic model was used and if the gas/condensate recovery after condensate dropout has not considered the positive impact of coupling (capillary number) or negative impact of inertia, you may want to consider their impact. I would not expect this consideration change the overall conclusions but may change the numbers.

I am afraid I do not have any plan to come to Iran and hence, can not attend your workshop. Maybe in future there are other opportunities that we could collaborate.

Kind regards

Jami
